New ways of looking at security management

The central focus of AEOS faces is the end user and the specific tasks of the individual end user. User friendliness and usability are key. Complex systems become easier to work with, and user errors are reduced significantly. This benefits productivity and security.

User friendly

AEOS faces supports each role within your organisation with its own interface, designed for the specific tasks of the employees and to support the work process in a logical manner. For example, a receptionist makes different demands of the system to those of your security officer or logistics manager. This system will adapt itself to the wishes and tasks of your employees, rather than the other way round.

Deployable

Advanced yet complex security management systems available on the market today, are in practice only used by limited number of staff. AEOS faces supports all other staff in making security related decisions in their day-to-day work. Existing systems are lacking simplicity and user friendliness for this group. The guard, receptionist, switchboard operator or door man can operate AEOS faces immediately, even without training.

Intuitive

The user navigates through the graphic interface using buttons and icons. A single click then closes a door or opens an intercom connection. A complex system that is easy to understand - which is just how it should be.

Conveniently arranged

The status of doors, break-in switches and other parts of the security management system can be seen at a glance. There is less user support needed, which is useful in the case of new employees or temporary staff, for example.

Task-oriented

The interface only displays that which is necessary for the user: only the current situation and relevant functions. This ensures that the user is not distracted by other peoples' tasks.

Accessible

AEOS faces is wholly web-based. The system can be used from any workstation, using a standard web browser. Installation of client software is not necessary. This means that more employees can benefit from the possibilities offered by Nedap AEOS. And above all - you save on your IT costs.

Flexible

Organisations are becoming increasingly dynamic, making high demands on the configurability of their system. AEOS faces enables rapid changes in the interface of the security management system: one less thing to worry about in the event of reorganisations, process changes or staff changes.

A practical example

A factory decides to lock its access gates during the daytime, following a string of opportunistic thefts. Visitors are therefore required to identify themselves via the intercom. However, operating the gates promptly proves difficult. Only one workspace has been set up for it which is often empty, resulting in frustrated visitors and suppliers.

AEOS faces provides the solution. Only a single web page is developed, the 'face'. This one page contains a button for operating the intercom, a button to open the gate, and the camera image. As soon as the camera detects motion, this web page appears automatically at five workspaces. If one of the employees takes on the task, the page disappears automatically from the other workspaces. A godsend!

New ways of looking at security management

AEOS faces framework

AEOS faces is a framework of standard building blocks, with which a solution can be developed for every problem. With AEOS faces, you can build graphic interfaces for each situation, using Java applets.

Building blocks

The strength of AEOS faces is in its use of specially developed Java applets. These building blocks are specially developed for security management. They manage the traffic between web pages at the front end and the underlying Nedap AEOS system. So that users can view and manipulate the status of the various AEOS elements in real time, through a browser. And you decide how complex or simple the web page is. The tasks and work processes within your organisation form the guiding principle.

Integration

AEOS faces is web-based, and therefore integrates seamlessly with other web applications. This could include an internal telephone list or an incident reporting system, for example. You simply include these elements in your AEOS web page. The reverse is also possible - to make AEOS faces part of your intranet.

Industry standards

AEOS faces is based on a number of open standards such as HTML, JavaScript and Java. This means that you get maximum benefit from the lightning fast developments in this industry. You put together the interfaces using familiar, user-friendly editors such as Microsoft FrontPage and Macromedia Dreamweaver. Childs play!

Security standards

With AEOS faces, you are choosing the security and safety you have come to expect from Nedap AEOS. AEOS faces also complies with the strictest IT security standards. Communication with the AEOS server is authenticated and encrypted on the basis of certificates. Furthermore, all actions are registered by AEOS faces in a detailed audit trail.

AEOS faces package

AEOS is supplied as standard with Nedap AEOS from version 2.1 on. Apart from an extremely solid security management system, it also contains an extensive collection of sample screens and icons, allowing easy creation of graphic interfaces.

Customised

Thanks to an extensive collection of sample screens with source code, you can create a large proportion of the desired standard functionality. An extensive library containing icons is available if supplementary functionality is needed. These icons immediately ensure a professional look and feel of your screens.

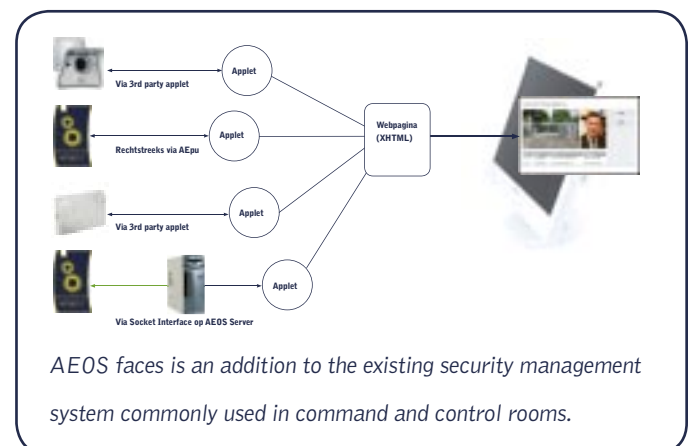

Powerful

Nedap AEOS V2.1 introduces a new concept for the integration of third-party security systems within Nedap AEOS. This is known as controller-level integration, and is simple, robust and scalable. Not only doors, but also break-in panels, CCTV

systems, intercom systems, fire alarm switches and light switches can also be operated through Nedap AEOS.

License model

No additional license costs are charged for AEOS faces. Are you already a customer of Nedap AEOS and do you have Software Assurance? Then you will automatically be given access to AEOS faces.

Nedap developed AEOS security management system on open industry standards. This allows you to take decisions without restriction for each purchase again. This is the best stimulus for Nedap to exceed your expectations time after time. AEOS faces allows you to combine a proven system with user-friendly interfaces. Leveraging your IT and security investments to max.
